- Would be helpful to have a log system and be able to clear it
- Ability to configure Hz
- Need to work on settings
- Prefers buttons, default to camera 2
- Keep lighter color scheme or toggle for light mode due to sun
- Stick to visuals, vehicle too loud to hear anything from interface
- They do have coregistered lidar and camera, render an occupancy grid instead of lidar because of computational intensity
- Resolution changes, square meter
- There aren't any faults in the current data, they're going to get us a bag with faults in it
- Two types of problems, one that cascades or one that stays hidden
- Define multiple points, like point A point B point C, and it will calculate intermediate points, but generally it is just given a goal point, starts at 0, 0 and is given a goal of 100, 100 or so
- A lot of high level derived information, good but pretty heavy workload, we need to look at the data a little closer, mostly raw data
